

IMA Commission on New Minerals, Nomenclature and Classification (CNMNC) – Newsletter 68

Ritsuro Miyawaki¹, Frédéric Hatert², Marco Pasero³, and Stuart J. Mills⁴

¹Chairman, CNMNC | Department of Geology, National Museum of Nature and Science,
4-1-1 Amakubo, Tsukuba 305-0005, Japan

²Vice-Chairman, CNMNC | Laboratoire de Minéralogie, Université de Liège, Bâtiment B18,
Sart Tilman, 4000 Liège, Belgium

³Vice-Chairman, CNMNC | Dipartimento di Scienze della Terra, Università di Pisa,
Via Santa Maria 53, 56126 Pisa, Italy

⁴Secretary, CNMNC | Geosciences, Museum Victoria, P.O. Box 666, Melbourne, Victoria 3001, Australia

Correspondence: Marco Pasero (marco.pasero@unipi.it)

Published: 31 August 2022

The information given here is provided by the IMA Commission on New Minerals, Nomenclature and Classification for comparative purposes and as a service to mineralogists working on new species.

Each mineral is described in the following format:

- mineral name, if the authors agree on its release prior to the full description appearing in press
- chemical formula (ideal formula)
- mineral symbol
- type locality
- full authorship of proposal
- e-mail address of corresponding author
- relationship to other minerals
- crystal system, space group, structure determined, yes or no
- unit-cell parameters
- strongest lines in the X-ray powder diffraction pattern
- type specimen repository and specimen number
- citation details for the mineral prior to publication of full description

Citation details concern the fact that this information will be published in the *European Journal of Mineralogy* on a routine basis, as well as being added month by month to the commission's website. It is still a requirement for the authors to publish a full description of the new mineral.

No other information will be released by the commission.

1 New mineral proposals approved in June 2022

IMA no. 2021-017a

Ermeloite

$\text{Al}(\text{PO}_4) \cdot \text{H}_2\text{O}$

Erm

Mount Ermelo, Moaña, province of Pontevedra, Galicia, Spain (42° 17' 50" N, 8° 45' 15" W)

Guillermo Zaragoza Vérez*, Carlos J. Rodríguez Vázquez, Inés Fernández Cereijo, José González del Tánago, Ramón Jiménez Martínez, Bruno Dacuña Mariño, Ramiro Barreiro Pérez, Ezequiel Vázquez Fernández, Montse Gómez Dopazo, and Oscar Lantes-Suárez

*E-mail: g.zaragoza@usc.es

Kieserite group

Monoclinic: $C2/c$; structure determined

$a = 6.5371(4)$, $b = 7.5670(5)$, $c = 7.1146(5) \text{ \AA}$,
 $\beta = 115.335(2)^\circ$

4.653(67), 4.570(33), 3.275(100), 3.197(44), 2.871(25),
2.471(40), 2.449(30), 2.052(15)

Type material is deposited in the mineralogical collections of the Museo de Historia Natural (MHN), University of Santiago de Compostela, Parque Vista Alegre s/n, 15782 Santiago de Compostela, Spain, catalogue number CM64083

3 Nomenclature/classification proposals approved in June 2022

3.1 IMA 22-D: borishanskiite discredited

New analyses of the holotype sample of borishanskiite (IMA no. 1974-010) show that this mineral is identical to polarite (IMA no. 1969-032). Consequently, since polarite has historical priority, borishanskiite is discredited.

3.2 Columbite supergroup

The columbite supergroup has been established. It includes 39 oxide minerals based on the general stoichiometry $M : O = 1 : 2$ and structurally characterized by zig-zag chains of edge-sharing octahedra. The supergroup is divided into the following: ixiolite group, wolframite group, samarskite group, columbite group, and wodginite group. A number of actions were taken on some of the minerals belonging to the supergroup; the most relevant among them are as follows:

- Polycrase-(Y) has been discredited, as it is identical to euxenite-(Y), and the latter mineral has historical priority.
- The old “ixiolite” has been redefined and results now in two distinct mineral species: ixiolite-(Mn²⁺), with end-member formula $(\text{Ta}_{2/3}\text{Mn}_{1/3}^{2+})\text{O}_2$, and ixiolite-(Fe²⁺), with end-member formula $(\text{Ta}_{2/3}\text{Fe}_{1/3}^{2+})\text{O}_2$. The type locality for both is Skogsböle, Kimito Island, Finland.

3.3 Revised formula for shkatulkalite, $\text{Na}_2\text{Nb}_2\text{Na}_3\text{Ti}(\text{Si}_2\text{O}_7)_2\text{O}_2(\text{FO})(\text{H}_2\text{O})_4(\text{H}_2\text{O})_3$

In the IMA List of Minerals the chemical formula of shkatulkalite is given as $\text{Na}_{10}\text{MnTi}_3\text{Nb}_3(\text{Si}_2\text{O}_7)_6(\text{OH})_2\text{F} \cdot 12\text{H}_2\text{O}$. However, a crystal structure study carried out on holotype material (*Can. Mineral.*, 60, 493–512, 2022) clearly shows that Mn is not the dominant constituent at any crystallographic site. Accordingly, the end-member formula should be written as $\text{Na}_2\text{Nb}_2\text{Na}_3\text{Ti}(\text{Si}_2\text{O}_7)_2\text{O}_2(\text{FO})(\text{H}_2\text{O})_4(\text{H}_2\text{O})_3$. This formula matches the general formula of the minerals of the lamprophyllite group of the seidozerite supergroup, to which shkatulkalite belongs. This is an executive decision taken by the officers of the IMA-CNMNC.
